LOW COST!

BirdMark – Model BM-AG (After Glow) Bird Flight Diverter

- Easily installed by hot stick
- Highly visible day and night and effective in changing bird's flight path
- Easily moved for seasonal flight path variations
- Fully tested and developed by biologists to be the most effective bird diverter
- BirdMark sways and reflects in the wind alerting the birds of obstructions, then at dusk glows up to 10 hours to warn birds
- Rugged spring loaded clamp prevents line slippage
- Hazes birds from buildings and structures

BirdMark Model BM - AG

BirdMark Bird Flight Diverters are designed to prevent collisions of larger and smaller birds...swans, eagles, hawks, ducks and geese with unseen power lines. Birds often cannot see the power lines on the horizon then lack the maneuverability to avoid the power lines when they get close enough to see them. The **BirdMark Model BM-AG** offers a low cost, permanent solution for helping endangered species avoid power lines in traditional flight paths.

New Night Glow Capability

Most bird diverters were developed to help birds avoid obstructions during daylight. Recent studies indicate that most bird collisions often happen during low light situations such as fog, rain and hours near and after dusk. Our revolutionary new **BirdMark Model BM-AG (After Glow)** white disk, glows up to 10 hours after the sun has set, giving almost full protection to the over 1 million birds that are killed annually in North America. Our new **BirdMark BM-AG** makes older spiral diverters obsolete.

Easy to Install

BirdMarks are designed to securely grip all cables up to a diameter of 2 1/2" (70mm) with our patented SnapFast KL-70 clamping jaws. The **BirdMark BM-AG** can be installed and removed from the ground without interrupting power. Once in position, the grip is such that the **BirdMark BM-AG** stays in position, even in a Force 8 gale.

Easy to See

BirdMarks stand out like a beacon against background features, letting birds see where the power lines are, and in the wind, **BirdMarks** emit a warning sound to the birds while they sway in the wind. Highly reflective orange and yellow reflective tape is positioned in the center of each **BirdMark BM-AG** to assist in warning oncoming birds.

Dimensions

11 1/2" total length
5 3/8" diameter white disk

- * Orange and Yellow reflective tape located in center of each **BirdMark BM-AG**
- * Use 15ft. spacing for best results
