SpanBRITE

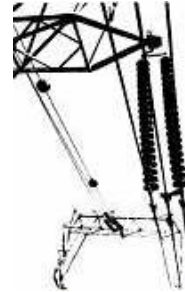

POWER LINE MARKERS

SpanBRITE Line Markers are an advanced development in making power lines visible to low flying aircraft, even night, thus protecting valuable power lines and saving lives.

The exclusive SpanBRITE coating makes the markers visible at night. SpanBRITE markers are international orange, or white, or yellow during the day and have been tested as visible to 2500 feet away at night with helicopter landing lights. They can be seen at 750 feet at night with a small flash light.

SpanBRITE markers can be supplied in the same construction as SpanGUARD/HeliMARK markers, with built-in imbedded Preform armor rods, or our REDBELL universal markers at less cost.

SpanBRITE

Orange markers, whether SpanGUARD, Redbell or TQA, are excellent in the daytime. They are difficult to see at night. We have had good success in making the markers much more visible to airplanes at night by installing three 1-1/2" strips of reflective tape around the marker. We have looked at Phosphor paints; however, they are slow acting to glow in response to flashing aircraft lights. Reflective tape is better.
